

Application of the Week: WaveSecure

Like its name implies, **WaveSecure** is a security application for Nokia S60 devices that helps users protect both their mobile device in case it lost or stolen, as well as their personal data and privacy. In the event of a loss, this client/server anti-theft software solution provides advanced locking, tracking, and monitoring systems to help you recover your valuable S60 device.

WaveSecure, developed by Singapore-based tenCube Pte. Ltd., also offers complete and automatic backup of personal data over the Web, ensuring that you always have a backup copy without any extra effort. And it protects your privacy with auto-lock features and the ability to trigger a remote wipeout of all personal data so that no one else can use it for their personal gain. If a thief takes your phone, it can easily be rendered worthless. The software can also remotely sound an audible alarm on the lost S60 device that will be easily noticed by anyone within earshot.

If, however, the phone was found by a Good Samaritan, the software can send a SMS message to the device giving instructions on how to properly return it.

WaveSecure also tracks any new subscriber identity module (SIM) cards that are inserted into the lost phone, and sends an SMS Alert to a chosen buddy system. The application can be set to auto-lock the device if the SIM card is changed.

WaveSecure was featured in late 2008 in the **Forum Nokia Innovation Series**. Return to the Application of the Week main page for more information about WaveSecure, or visit their website to get details about an over-the-air software download: www.wavesecure.com. For individuals living in India, WaveSecure comes preinstalled on all Nokia N96 multimedia computers.
