

## Application of the Week: NAVITIME

**NAVITIME** is an award-winning point-to-point navigation application for use with S60 mobile devices, enabling individuals to find the fastest and most practical travel route from “point A” to “point B” through a combination of options, including walking, driving, public transit (trains, buses, ferries, etc.) and flying. The patented NAVITIME technology calculates the time and cost of travel based on timetable data, providing realistic results and real-time traffic information, wherever it is available.

GPS voice navigation is available when using walking routes, together with public transportation transit information. Estimates of the number of calories burned are provided for walking routes, and carbon dioxide emission is calculated for car and taxi routes.

You can save favourite and commonly used addresses in the My Locations portion of the application, and your favourite routes in the My Routes portion. You can also update this information as needed.

When used while driving, the NAVITIME application offers well-considered guidance points, including defining road types, and automatic positioning through the device's GPS capabilities. It also provides map-matching and map-scrolling capabilities.

NAVITIME, developed by Tokyo-based Navitime Japan Co, Ltd., can be used with the following S60 devices: Nokia N78, N82, N95, E66, E71, 6110 Navigator, and 6210 Navigator.
