

Application of the Week: Mobiola Video Studio

Mobiola Video Studio, from Shape Services in Stuttgart, Germany, is a conversion tool that can convert video files to a format acceptable for viewing on your S60 device. You can use this application to easily move videos to any target device with a single drag-and-drop operation on the PC.

When the application is started with a device connected to a PC, it automatically recognizes the S60 device, as well as the specific model number and video requirements.

For example, to convert a video on YouTube into a video that can be stored and viewed on your S60 device, you simply drag the file from the YouTube address bar onto the application box in Mobiola Video Studio associated with your S60 device. The application then downloads and converts the video file into the best format for that device, and sends it to your S60 device through either a Bluetooth or USB connection. The converted file is optimised for playback on your S60 device. Then, on the S60 device, you open the Video Clips folder, and play the video clip on the device with built-in video player. The application works on all S60 3rd Edition devices.

In addition to Mobiola Video Studio, the company offers another tool called "Mobiola Web Camera," which provides additional functionality to mobile phones. It allows you to use your mobile phone as a Web camera for your PC desktop or laptop computer. Video can be streamed from the phone's camera using Wi-Fi, Bluetooth, or USB interfaces to your computer, and used in any application that uses a Webcam, including Skype and MSN Messenger.
